

Our services often include a seamless alliance with Reliability Inspections LLC, of Racine, Ohio. Reliability Inspections is a technical service provider with expertise in code-based inspections and non-destructive testing (NDT). Their team includes certified inspectors in multiple disciplines, including API 510, 570 & 653, AWS-CWI & STI SP001 tank inspections, as well as a comprehensive range of NDT certified resources, specialized equipment and Level III services.

## Mechanical Integrity (MI) Programs and Inspections

The goal of the Kensington—Reliability Inspections alliance is to assist our customers in assuring the reliability and continued safe operation of their equipment, processes, and plant assets. Our combined team brings a wealth of regulatory, code, equipment and process operations knowledge and experience to our customers' projects. We believe it is important to work closely with our customers directly to set quality expectations and provide value-added deliverables to every project. Our approach is to carefully assess our client's specific needs to establish clearly defined scopes of work and resource requirements as we develop estimations for each project. We utilize and follow applicable regulations, codes and standards that reference or include methodologies and guidance for program development, inspection plans and associated mechanical integrity activities. Our experience with recognized and generally accepted good engineering practice (RAGAGEP) such as the API inspection codes, structural codes and design codes include practical applications and experience-based knowledge that can provide effective solutions to our client's compliance issues. We work with our customers to review new designs, fabrication, construction, installation, operation, ongoing maintenance, and retirement of process equipment focusing on mechanical integrity, inspection, and quality assurance.
